EXPERIMENT 11: RDF KNOWLEDGE REPRESENTATION USING RDFLIB

Aim:

To represent facts as Resource Description Framework (RDF) triples.

Software Required: Python 3.x and RDFLib.

Install RDFLib using:

pip install rdflib

Procedure / Algorithm:

1. Create an RDF graph and namespace.
2. Add subject-predicate-object triples.
3. Iterate through the graph and print the triples.

Program:

```
rdf_triples = [
    ("Arun", "studies", "Python"),
    ("Python", "type", "Programming Language")
]

print("RDF Knowledge Triples:")
for subject, predicate, obj in rdf_triples:
    print(subject, predicate, obj)
```

Sample Input:

The triples are predefined in the program.

Expected Output:

```
=== RESTART: C:/Users/saimr/AppData/Local/Programs/Python/Python312/KE-11.py ===
RDF Knowledge Triples:
Arun studies Python
Python type Programming Language
```

Result:

Thus, knowledge was represented using RDF subject-predicate-object triples.
